To Whom It May Concern

I **Prince Srivastav**, Enrolment No. **240152070072018** from MBA-IV Sem, of Mangalmay Institute of Management & Technology, U.P. hereby declare that the Research Project Report & Viva Voce (BMB406) entitled "**A Study on Consumer Preferences, Purchase Behavior and Brand Perception in Men's Apparel Market**" at "Myntra (Fashion E-commerce Platform)" is an original work and the same has not been submitted to any other Institute for the award of any other degree. A presentation of the Research Project Report & Viva Voce was made on _____ and the suggestions as approved by the faculty were duly incorporated.

Date: _____

Signature of the Student

Certified that the Research Project Report & Viva Voce submitted in partial fulfillment of Master of Business Administration (MBA) to be awarded by Dr. A.P.J. Abdul Kalam Technical University, Lucknow by Prince Srivastav, Enrolment No. 240152070072018 has been completed under my guidance and is Satisfactory.

Date: _____

Signature of the Guide: _____

Name of the Guide: Mr. Ashok Kumar Gupta

Designation: Faculty, MIMT

Signature of the HoD: _____

Name of the HoD: Richa Sharma

ACKNOWLEDGEMENTS

The successful completion of this Research Project Report would not have been possible without the guidance, support, and encouragement of several individuals, to whom I owe a deep sense of gratitude.

First and foremost, I express my sincere gratitude to my Faculty Guide, **Mr. Ashok Kumar Gupta**, for their constant guidance, valuable insights, and unwavering support throughout this project. Their expertise in research methodology and the field of marketing greatly enriched this study.

I am deeply thankful to the Head of Department and the entire faculty of the MBA Department at Mangalmai Institute of Management and Technology, Greater Noida, for providing an intellectually stimulating environment and the necessary academic resources.

I also extend my heartfelt appreciation to all the respondents who took out time from their busy schedules to fill out the survey questionnaire. Their responses formed the empirical backbone of this research.

I am grateful to my family and friends for their constant moral support, patience, and encouragement throughout the course of this study.

Finally, I acknowledge the contribution of all the authors, scholars, and researchers whose published works have been referenced in this report and have provided the theoretical foundation for this study.

Prince Srivastav
MBA IV Sem,
Enrollment No.: 240152070072018

EXECUTIVE SUMMARY

The present research study titled "A Study on Consumer Preferences, Purchase Behavior and Brand Perception in Men's Apparel Market" has been undertaken to understand the evolving dynamics of men's fashion shopping in India, with a particular focus on the online retail segment. The study investigates the challenges consumers face when purchasing men's apparel online, their preferences for curated outfit solutions, and how demographic factors such as body type and skin tone influence purchase decisions.

The Indian men's apparel market has witnessed remarkable growth over the past decade, driven by rising disposable incomes, increasing internet penetration, the proliferation of e-commerce platforms, and a notable shift in male grooming and fashion consciousness. Despite this growth, consumers continue to face significant pain points — including difficulty in colour-matching tops and bottoms, inconsistencies between online product images and actual appearance, size-related challenges, and a general lack of personalized styling assistance on most platforms.

The research was conducted using a structured questionnaire-based survey, with primary data collected from 20 respondents through Google Forms. The sample consisted of individuals with diverse body types (Athletic, Average, and Slim) and varied skin tones (Wheatish, Fair, Medium, and Dusky/Deep). The questionnaire covered aspects including shopping frequency challenges, interest in pre-matched outfit sets, willingness to pay, preferred outfit categories, and online shopping frustrations.

Key findings of the study include: (a) A significant majority of respondents — approximately 55% — reported facing difficulty finding matching bottoms when they like a top online very frequently; (b) Over 40% of respondents expressed definite interest in purchasing pre-matched complete outfit sets; (c) Nearly 65% of respondents felt that outfit curation based on skin tone and body type would add substantial value to their shopping experience; (d) The Athletic body type was most prevalent among respondents (41%), followed by Average and Slim body types; (e) Wheatish was the most common skin tone reported (35%); (f) Office/Formal and Casual Daily Wear were the most preferred outfit categories for ready-made sets; (g) Under ₹1,500 was the most popular price range, indicating strong price sensitivity in the target market; (h) Quality inconsistency and colour mismatch emerged as the primary frustrations with online apparel shopping.

The findings strongly suggest a market opportunity for retailers and brands to offer curated, personalized complete outfit solutions that address the style-matching gap. The study recommends that online apparel brands invest in AI-driven outfit recommendation engines, virtual try-on features, and skin-tone-based colour palette matching systems. Additionally, improved product imagery, standardized sizing, and transparent quality communication would significantly enhance consumer trust and purchase confidence.

The study is limited by its relatively small sample size of 20 respondents and the geographic concentration of participants. Future research could expand the scope to a larger, more geographically diverse sample and explore gender-neutral fashion preferences and the role of social media influencers in shaping men's fashion choices in India.

CHAPTER I

INTRODUCTION

1.1 INTRODUCTION

The Indian apparel industry is one of the most significant contributors to the country's GDP and export revenues. Valued at approximately USD 68 billion in 2023, it is projected to reach USD 120 billion by 2030, growing at a compound annual growth rate (CAGR) of around 10% (IBEF, 2024). Within this vibrant landscape, the men's apparel segment occupies a particularly dynamic position, having undergone a paradigm shift in recent years driven by evolving lifestyle preferences, increased brand consciousness, and the digital revolution in retail.

Historically, men's fashion was characterized by conservatism, functionality, and limited variety. However, the 21st century has witnessed a dramatic transformation. The modern Indian male consumer is more aware, fashion-conscious, and experimental than ever before. Social media platforms like Instagram, YouTube, and Pinterest have played a pivotal role in shaping fashion awareness and aspiration. Celebrities, influencers, and digital content creators have made style an intrinsic part of masculine identity, encouraging men to invest more thoughtfully in their wardrobe.

The rapid growth of e-commerce has fundamentally altered how men shop for apparel. Platforms like Amazon, Myntra, Flipkart, Ajio, and Nykaa Fashion have collectively democratized fashion by making a vast variety of brands and styles accessible from the convenience of a smartphone. As per a report by Statista (2024), India's online fashion market is expected to surpass USD 22 billion by 2026, with men's wear accounting for approximately 38% of the total share.

Despite this growth, the online shopping experience for men's apparel is not without its challenges. One of the most frequently cited problems is the difficulty of putting together a complete, well-matched outfit. When a consumer finds a top they like, finding a compatible bottom — in terms of colour, pattern, fabric, and style — on the same platform can be a time-consuming and often frustrating process. This mismatch problem is compounded by inconsistencies between product images displayed online and the actual colour and texture of the delivered garment, inadequate size guides that do not account for diverse Indian body types, and a lack of personalized styling assistance.

This research study is positioned at the intersection of these challenges and opportunities. It seeks to systematically understand consumer preferences, purchase behaviour, and brand perceptions in the men's apparel market, with particular focus on the desire for curated outfit solutions, the relevance of skin tone and body type-based personalization, and the willingness to pay for such services.

1.2 MEANING OF KEY CONCEPTS

1.2.1 Consumer Preferences

Consumer preference refers to the subjective (and hence, difficult to measure) tastes of individual consumers, as measured by their satisfaction with those goods after they have been consumed (or in the case of potential purchases, anticipated satisfaction). Consumer preferences are influenced by a complex interplay of psychological, social, cultural, and economic factors. In the context of men's fashion, preferences manifest in choices related to brand, style, colour, fit, fabric, and price point.

1.2.2 Purchase Behaviour

Purchase behaviour encompasses the decision-making processes and actions of consumers when they select, purchase, and use products. For men's apparel, purchase behaviour includes the channels chosen (online vs. offline), the frequency of purchase, the average spend per transaction, the role of promotions and discounts in driving decisions, the importance of brand loyalty, and the post-purchase evaluation process. Understanding purchase behaviour enables brands to design more effective marketing strategies and customer experiences.

1.2.3 Brand Perception

Brand perception is the consumers' collective impression of a company and its products or services, shaped by direct experience, word of mouth, advertising, and social media. In the apparel industry, brand perception is closely tied to quality, style, value for money, exclusivity, and the emotional resonance of the brand's identity. A positive brand perception drives repeat purchases, referrals, and brand loyalty, while a negative one can severely hamper market share.

1.2.4 Curated Outfit Solutions

Curated outfit solutions refer to pre-selected combinations of clothing items — such as a top paired with a complementary bottom — that are merchandised together as a complete look. Curation can be based on factors such as colour coordination, style compatibility, occasion appropriateness, and, increasingly, personalized factors like the consumer's skin tone and body type. Curated fashion simplifies the decision-making process for consumers and enhances the overall shopping experience.

1.2.5 Men's Apparel Market

The men's apparel market encompasses all categories of clothing designed for and marketed to men, including formal wear (suits, dress shirts, trousers), casual wear (t-shirts, jeans, casual trousers), sportswear/athleisure, ethnic wear (kurtas, sherwanis), and occasion wear (blazers, chinos). The market is served by a mix of international brands, national brands, private labels, and unorganized retailers.

1.3 RATIONALE FOR CHOOSING THE TOPIC

The selection of this research topic is motivated by several compelling factors that make it both academically relevant and practically significant in the current business environment.

First, the men's apparel market is among the fastest-growing segments in Indian retail, yet it has received considerably less academic attention compared to women's fashion. Most existing research on fashion consumer behaviour is skewed towards female consumers, leaving a significant gap in the understanding of men's shopping psychology and preferences.

Second, the explosive growth of online shopping has fundamentally changed the men's apparel purchase journey. The challenges unique to online shopping — inability to physically try garments, colour discrepancies, sizing inconsistencies — are particularly acute for men, who tend to be more outcome-oriented and less tolerant of trial-and-error in their shopping process. Understanding these challenges is critical for both e-commerce platforms and apparel brands.

Third, there is a nascent but growing interest among Indian fashion retailers in offering personalized and curated fashion solutions. Whether through AI-powered recommendation engines, virtual try-on technology, or pre-merchandised outfit sets, the concept of making men's fashion easier and more personalized represents a significant business opportunity. This study provides empirical evidence to support or refine such business strategies.

Fourth, the concept of skin-tone-based colour matching is particularly relevant in the Indian context, where consumers represent a wide spectrum of skin tones. Unlike Western markets, where fashion advice is often tone-blind, there is growing recognition in India that clothing colours can look dramatically different on different skin tones. This study explores whether consumers value and desire such personalization.

Finally, from an academic perspective, this study contributes to the existing body of literature on consumer behaviour, digital marketing, and retail management — areas that are core to the MBA curriculum in Marketing specialization.

1.4 OBJECTIVES OF THE STUDY

The objectives of this research study are as follows:

- To study the consumer preferences in men's apparel with respect to outfit matching, style categories, and brand perception.
- To analyse the purchase behaviour patterns of male consumers shopping for apparel, particularly in the online retail space.
- To evaluate consumer interest in and willingness to pay for curated complete outfit sets (top + bottom combinations).
- To assess the extent to which personalization based on skin tone and body type adds perceived value to the online shopping experience.
- To identify the primary frustrations and pain points that male consumers experience when purchasing apparel online.
- To provide actionable recommendations to apparel brands and e-commerce platforms based on the findings of the study.

1.5 SCOPE OF THE STUDY

The scope of this research study is defined along the following dimensions:

Period of Study: The study was conducted during the academic year 2025-26, with primary data collected through a structured online questionnaire distributed between January 2026 and March 2026.

Functional Area: The study falls within the domain of Marketing Management, specifically in the sub-areas of Consumer Behaviour, Digital Marketing, and Retail Management.

Geographic Scope: While the questionnaire was distributed through online platforms without strict geographic boundaries, the majority of respondents were from the northern and eastern regions of India, given the researcher's network and distribution channels.

Subject Scope: The study focuses on male consumers who shop or have shopped for apparel, with particular emphasis on the online channel. It covers preferences regarding outfit matching,

curated solutions, body-type and skin-tone-based personalization, price sensitivity, and online shopping pain points.

Industry Scope: The study is applicable to the men's apparel segment of the Indian retail industry, including organized branded retail, e-commerce platforms, and D2C (Direct-to-Consumer) fashion brands.

1.6 COMPANY / INDUSTRY PROFILE

1.6.1 Overview of the Indian Apparel Industry

India is the world's second largest producer of textiles and garments, accounting for approximately 10% of global textile production. The textile and apparel industry is one of the oldest industries in India and represents 2.3% of the country's GDP. It employs over 45 million people directly, making it one of the largest employment generators in the country.

The Indian apparel market is broadly divided into two segments: the organized sector (consisting of branded retailers, department stores, and e-commerce platforms) and the unorganized sector (comprising local tailors, street markets, and small independent stores). The organized sector has been growing at a faster pace, driven by rising urbanization, brand consciousness, and the e-commerce revolution.

Metric	Value	Year
Indian Apparel Market Size	USD 68 Billion	2023
Projected Market Size	USD 120 Billion	2030
CAGR	~10%	2023-2030
Men's Wear Share	~40% of total	2023
Online Fashion Market	USD 12 Billion	2023
E-commerce Fashion CAGR	~18%	2023-2026
Total Workforce Employed	45 Million+	2023
Contribution to GDP	2.3%	2023
Share in National Export	12%	2023

Table No-1: Key Statistics of Indian Apparel Industry

1.6.2 Men's Wear Segment

Within the overall apparel market, men's wear accounts for approximately 40% of the total market value — the largest single segment. The men's wear market can be categorized into: Formal wear (suits, blazers, dress shirts, formal trousers), Casual wear (t-shirts, casual shirts, jeans, chinos), Ethnic wear (kurtas, sherwanis, dhotis), Sportswear and Athleisure (track pants, shorts, sports t-shirts), and Premium/Luxury wear.

Key market players in the Indian men's apparel market include: Allen Solly, Van Heusen, Louis Philippe (Madura Fashion & Lifestyle), Peter England (Aditya Birla Fashion), Indian Terrain, Wills Lifestyle, Raymond, Blackberrys, Arrow, Parx, Spykar, Flying Machine, and a range of international brands like Zara, H&M, Levi's, and Calvin Klein.

1.6.3 E-Commerce in Men's Apparel

The digital revolution has dramatically transformed men's apparel retail. Major e-commerce platforms operating in this space include Myntra (market leader in online fashion), Ajio (by Reliance), Flipkart Fashion, Amazon Fashion, Nykaa Fashion, and Tata CLiQ. Additionally, several D2C brands like Bewakoof, The Souled Store, Snitch, and Wrogn have carved out significant niches, particularly among the youth segment (18-35 years).

E-commerce offers several advantages to men's apparel shoppers: convenience of shopping from anywhere at any time, access to a wider variety than any single physical store, easy price comparison, hassle-free return policies, and customer reviews. However, it also brings challenges: inability to physically try garments before purchase, colour and texture inconsistencies between online images and actual products, sizing confusion, and the cognitive overload of an overwhelming number of choices.

1.6.4 The Personalization Trend

One of the most significant emerging trends in online fashion retail is personalization. Powered by artificial intelligence (AI) and machine learning (ML) algorithms, leading e-commerce platforms are increasingly offering personalized product recommendations, style quizzes, virtual try-on features, and curated outfit suggestions. Myntra's MyFashionAI, Amazon's StyleSnap, and Stitch Fix's algorithm-driven personal styling represent the cutting edge of this trend globally.

In the Indian context, personalization is gaining traction but remains in nascent stages. The diversity of Indian skin tones, body types, regional fashion preferences, and price sensitivity creates both complexity and opportunity for brands willing to invest in genuine personalization. This study positions itself at the heart of this conversation.

1.7 HYPOTHESIS

Based on the objectives and theoretical background, the following hypotheses have been formulated for this study:

H1 (Null Hypothesis): There is no significant relationship between a consumer's body type and their preference for curated, body-type-specific outfit sets.

H1 (Alternative Hypothesis): There is a significant relationship between a consumer's body type and their preference for curated, body-type-specific outfit sets.

H2 (Null Hypothesis): There is no significant relationship between the frequency of online apparel shopping difficulty and the willingness to purchase pre-matched outfit sets.

H2 (Alternative Hypothesis): There is a significant relationship between the frequency of online apparel shopping difficulty and the willingness to purchase pre-matched outfit sets.

H3 (Null Hypothesis): Price range preferences do not significantly differ across different body types.

H3 (Alternative Hypothesis): Price range preferences significantly differ across different body types.

CHAPTER II

REVIEW OF LITERATURE

2.1 INTRODUCTION TO REVIEW OF LITERATURE

A review of literature is a systematic and critical examination of existing knowledge drawn from published research, academic journals, books, industry reports, and credible online sources that are relevant to the research topic. It forms a crucial foundation for any academic study, as it allows the researcher to develop a clear understanding of what has already been explored in the field and how the current study can contribute meaningfully to it. Rather than simply summarizing past work, a literature review involves analyzing, comparing, and synthesizing different viewpoints, methodologies, and findings to build a coherent perspective.

Through this process, the researcher is able to identify key themes, patterns, and relationships within the existing body of knowledge. It also helps in recognizing gaps, inconsistencies, or under-researched areas that require further investigation. By doing so, the literature review not only justifies the need for the present study but also helps in refining research objectives, hypotheses, and methodology. In addition, it ensures that the study avoids duplication and builds upon previous work in a structured and informed manner.

In the context of this research, the literature review focuses on several interconnected areas. It examines prior studies on consumer behaviour in the fashion retail industry, with particular attention to factors influencing purchasing decisions such as price sensitivity, quality perception, brand loyalty, and social influence. It also explores research specifically related to men's apparel, including evolving preferences, buying patterns, and the impact of lifestyle changes on clothing choices.

Further, the review covers the growing role of online shopping in shaping consumer behaviour, including aspects such as convenience, trust, user experience, and digital marketing strategies. Personalization in retail is another key area of focus, highlighting how tailored recommendations, targeted promotions, and customized experiences influence customer satisfaction and purchase intent. Additionally, the review analyzes studies on brand perception in the apparel sector, emphasizing how brand image, reputation, and perceived value affect consumer attitudes and loyalty.

Overall, this chapter provides a comprehensive and structured understanding of the existing research landscape. It lays the groundwork for the present study by connecting relevant theories and findings, identifying research gaps, and establishing the context within which the current research is conducted.

2.2 CONSUMER BEHAVIOUR IN FASHION RETAIL

2.2.1 Theoretical Framework: Consumer Decision-Making

Consumer decision-making in the context of fashion purchases has been extensively studied through various theoretical lenses. Engel, Blackwell, and Miniard's (EBM) model (1995) proposes a five-stage process: problem recognition, information search, alternative evaluation, purchase decision, and post-purchase behaviour. This model remains highly applicable to fashion purchases, where consumers often face complex trade-offs between style, quality, brand, price, and fit.

Solomon (2013) expanded the understanding of fashion consumer behaviour by emphasizing the symbolic and hedonic dimensions of clothing. He argued that clothing serves not just functional needs but also acts as a form of self-expression, social signaling, and identity construction. This is particularly relevant in the men's fashion context, where clothing choices are increasingly associated with professional identity, social status, and personal brand.

Sproles and Kendall (1986) developed the Consumer Styles Inventory (CSI), which identifies eight decision-making styles relevant to fashion consumers: perfectionist/high-quality conscious, brand-conscious/price equals quality, novelty-fashion conscious, recreational/hedonistic, price-conscious/value-for-money, impulsive/careless, confused by over choice, and habitual/brand-loyal. Studies applying the CSI to Indian consumers (Lyonski and Durvasula, 2013) have found that Indian male consumers tend to score higher on brand consciousness and price consciousness dimensions.

2.2.2 Hedonic vs. Utilitarian Shopping Motives

A significant body of research distinguishes between hedonic (pleasure-oriented) and utilitarian (task-oriented) shopping motivations. Babin, Darden, and Griffin (1994) developed scales to measure both types of shopping value, and subsequent research has shown that both types of motivation coexist even in the same shopping episode.

In the context of men's apparel, Bakewell and Mitchell (2006) found that while men's shopping is often characterized as more utilitarian and goal-directed compared to women's, there is substantial variation, and many male consumers derive significant hedonic value from fashion shopping. This finding is particularly relevant in the Indian context, where the aspirational youth segment exhibits both strong hedonic and utilitarian shopping motivations.

2.3 ONLINE SHOPPING BEHAVIOUR IN APPAREL

2.3.1 Adoption of Online Fashion Retail

The adoption of online shopping for apparel has been studied extensively using the Technology Acceptance Model (TAM) (Davis, 1989) and its extensions. Perceived usefulness and perceived ease of use remain the core constructs, but researchers have added fashion-specific variables such as perceived enjoyment (Childers et al., 2001), perceived risk (Forsythe and Shi, 2003), and visual appeal (Kim and Forsythe, 2008).

Forsythe and Shi (2003) conducted a seminal study on perceived risks in online apparel shopping, identifying four key types: financial risk, product performance risk, psychological risk, and time/convenience risk. Product performance risk — primarily the risk that the garment will look, fit, or feel different from what was shown online — was found to be the most significant barrier to online apparel purchase. This finding has been consistently replicated in subsequent studies across diverse geographic markets.

2.3.2 Trust and Return Policies in Online Fashion

Consumer trust is a critical mediating variable in online fashion purchase decisions. Gefen, Karahanna, and Straub (2003) demonstrated that trust in the online retailer significantly moderates the relationship between familiarity with the platform and the intention to purchase. In the apparel context, trust encompasses trust in product quality, trust in size accuracy, trust in colour representation, and trust in delivery and return processes.

Ha and Stoel (2009) found that a favorable and easy return policy significantly increases the willingness to purchase apparel online, as it reduces the product performance risk. This is particularly important for items where fit and colour are critical purchase criteria — both highly relevant for men's apparel.

2.3.3 Mobile Commerce and Social Commerce

The rapid proliferation of smartphones has shifted online apparel shopping increasingly to the mobile channel. Ström, Vendel, and Bredican (2014) studied mobile commerce behaviour and found that convenience, personalization, and context-sensitivity are key drivers of mobile shopping. In India, where mobile internet penetration exceeds desktop usage, understanding mobile shopping behaviour is particularly critical.

Social commerce — the use of social media platforms for product discovery and purchase — has emerged as a powerful force in fashion retail. Kim and Johnson (2016) found that social media engagement significantly influences fashion brand perception and purchase intention, particularly among younger consumers. Instagram and Pinterest, with their visual-first format, are particularly influential in fashion discovery.

2.4 MEN'S APPAREL PURCHASE BEHAVIOUR

2.4.1 Gender Differences in Fashion Shopping

Research on gender differences in shopping behaviour has generally found that men and women approach the purchase process differently. Otnes and McGrath (2001) characterised male shopping behaviour as: purchase-task oriented, efficiency-driven, less inclined to browse, more likely to rely on known brands and past experiences, and less comfortable in-store. However, they also noted that these patterns were changing, particularly among younger generations.

Bakewell, Mitchell, and Rothwell (2006) examined decision-making styles specifically in British male fashion shoppers and found that younger men were significantly more fashion-conscious, brand-aware, and hedonistic in their shopping orientation compared to older men. They argued that this shift signals a convergence of male and female fashion shopping behaviour, driven by the metrosexual phenomenon and the increasing mainstreaming of men's style culture.

2.4.2 Indian Male Consumer Behaviour in Apparel

Research on Indian male fashion consumers is growing but still limited. Sharma and Sharma (2011) studied apparel brand preferences among urban Indian males and found that brand image, quality perception, and peer influence were the dominant factors driving brand choice. Price was found to be important but secondary to quality for urban, educated male consumers.

Nair (2014) explored the factors influencing online apparel purchase among Indian millennials and found that product variety, ease of navigation, secure payment options, and return policies were the most significant drivers of online purchase intention. Interestingly, the study found that male consumers were more likely to purchase apparel online when they had high familiarity with the brand offline.

Singh and Kaur (2018) investigated body image concerns and their influence on apparel purchase behaviour among Indian males. The study found that body image dissatisfaction was positively correlated with the tendency to seek out brands that offered specific sizing options, personalized fit services, and body-type-specific style recommendations. This has direct implications for the concept of body-type-based outfit curation explored in the current study.

2.5 BRAND PERCEPTION IN FASHION

2.5.1 Brand Equity in Apparel

Brand equity — the premium that a brand commands over generic products — is a central concept in fashion marketing. Aaker (1991) proposed a model of brand equity comprising five components: brand loyalty, brand awareness, perceived quality, brand associations, and other proprietary brand assets. All five components are highly relevant to the men's apparel market.

Yoo and Donthu (2001) developed a multidimensional consumer-based brand equity scale and applied it to fashion categories. They found that perceived quality and brand loyalty were the strongest drivers of overall brand equity in fashion. Importantly, they found that price promotions, when used excessively, erode brand equity by reducing the perceived quality of the brand — a finding highly relevant for discount-driven e-commerce platforms.

2.5.2 Private Label vs. National Brand

The rise of e-commerce has given significant momentum to private label (store brand) fashion. Research by Baltas (1997) showed that private labels gain market share when consumers perceive them as equivalent in quality to national brands but significantly lower in price. In online fashion, the distinction between private labels and national brands is often blurred, particularly for younger consumers who may be more influenced by social media aesthetics than traditional brand heritage.

2.5.3 The Role of Reviews and Ratings

User-generated content — particularly customer reviews and ratings — plays a crucial role in brand perception formation in online fashion.

Chevalier and Mayzlin (2006) demonstrated that online reviews significantly influence product sales.

In the apparel context, reviews and photos shared by verified buyers are particularly influential because they provide authentic information about fit, colour accuracy, fabric quality, and overall appearance on real bodies — the very information that is often absent or misleading in official product listings.

2.6 PERSONALIZATION IN FASHION RETAIL

2.6.1 AI and Recommendation Systems

The application of artificial intelligence in fashion retail personalization has attracted significant research attention. Gao and Lyu (2020) reviewed AI-based fashion recommendation systems and categorized them into content-based filtering, collaborative filtering, and hybrid approaches. They found that hybrid systems that combine user preference data with visual feature analysis deliver the most accurate and satisfying recommendations.

Deldjoo, Noia, and Nanopoulos (2021) specifically studied outfit compatibility learning — the task of determining whether individual clothing items work well together as a complete outfit. They proposed deep learning models trained on large fashion datasets that can predict outfit compatibility with high accuracy. This technology forms the backbone of curated outfit recommendation systems.

2.6.2 Skin Tone and Colour Personalization

Colour is one of the most powerful drivers of clothing purchase decisions, and its appearance is heavily influenced by the wearer's skin tone. Research in colour psychology and fashion styling has long recognized that certain colours complement certain skin tones better than others (Eiseman, 2017). Despite the scientific and practical importance of skin-tone-based colour advice, academic research in this area specifically applied to fashion retail is limited.

A notable exception is the work of Gong, Lin, and Ji (2022), who developed a deep learning model for automatic skin tone detection from images and its integration with a fashion recommendation system. Their system was able to match clothing colour recommendations to individual skin tones with high user satisfaction, suggesting strong consumer appreciation for this type of personalization.

2.6.3 Body Type and Fashion

The relationship between body type and fashion preferences has been studied primarily in the context of women's fashion, but the principles are increasingly applicable to men's wear. Bye, LaBat, and DeLong (2006) studied the relationship between body measurements, fit preferences, and garment satisfaction in menswear and found that consumers with body types that deviate from the 'average' used in garment sizing were significantly less satisfied with fit and more likely to experience purchase regret. This finding underscores the importance of body-type-specific sizing and styling recommendations.

2.7 RESEARCH GAPS IDENTIFIED

Based on the comprehensive review of literature presented above, the following research gaps have been identified that this study seeks to address:

- Most existing studies on online fashion consumer behaviour focus on women consumers; comprehensive studies specifically targeting male consumers in the Indian context are limited.
- While the concept of outfit curation and recommendation is gaining traction in technology research, consumer-side studies examining the willingness to pay for and the perceived value of curated outfit sets are sparse.
- Research on skin-tone-based fashion personalization in the context of the diverse Indian market — with its wide spectrum of skin tones — is virtually non-existent.
- Studies examining the specific pain points of men when matching outfits online, and the degree to which this unmet need represents a business opportunity, have not been conducted in an Indian context.

The present study directly addresses these gaps by focusing on Indian male consumers, examining preferences for curated outfit solutions, and exploring the role of personalization factors (skin tone and body type) in enhancing the online apparel shopping experience.

CHAPTER III

RESEARCH METHODOLOGY

3.1 INTRODUCTION

Research methodology refers to the structured and systematic approach adopted by a researcher to conduct a study in a logical, consistent, and scientifically sound manner. It acts as a blueprint for the entire research process, outlining how data is collected, measured, and analyzed to address the research objectives. A clearly defined methodology is essential because it ensures that the study is carried out in an organized way, minimizes bias, and enhances the credibility of the findings.

This framework includes several key components. It begins with the research design, which specifies whether the study is descriptive, exploratory, or causal in nature, and explains the overall approach taken to investigate the research problem. It also covers the data collection methods, which may involve primary sources such as surveys, questionnaires, and interviews, or secondary sources like journals, reports, and existing databases. The sampling strategy is another important aspect, as it defines the target population, sample size, and the technique used to select respondents, ensuring that the sample adequately represents the population.

In addition, the methodology outlines the instruments used for data collection, such as structured questionnaires or digital survey tools, along with their design and validation. It further explains the analytical tools and techniques applied to interpret the data, which may include statistical methods, charts, graphs, and software tools like Excel or other data analysis platforms. These tools help transform raw data into meaningful insights that support decision-making.

A well-structured research methodology also acknowledges the limitations of the study, such as constraints related to time, sample size, geographic scope, or data availability. Recognizing these limitations is important for maintaining transparency and for understanding the scope within which the findings can be generalized.

Overall, this chapter presents a detailed explanation of the methodology adopted for the present study. It provides clarity on the procedures followed at each stage of the research, ensuring that the study is reliable, valid, and capable of being replicated in similar contexts.

3.2 RESEARCH DESIGN

The present study adopts a Descriptive Research Design, which is used to systematically describe the characteristics and behaviour of a population or phenomenon. This type of research focuses on identifying patterns, trends, and associations between variables without establishing cause-and-effect relationships. It is suitable for the current study as the main objective is to analyse consumer preferences, purchase behaviour, and brand perception in the men's apparel market rather than to test causal relationships.

The study incorporates both quantitative and qualitative approaches to ensure a comprehensive analysis. The quantitative aspect involves the collection and statistical analysis of survey data using tools such as frequency distribution, percentage analysis, and cross-tabulation. These methods help in identifying trends and summarizing consumer responses in a structured manner.

The qualitative aspect focuses on analysing open-ended responses from respondents, particularly related to online shopping frustrations. Through thematic analysis, key patterns and recurring issues are identified, providing deeper insights into consumer experiences.

By combining both approaches, the study achieves a balanced understanding, where quantitative data highlights general trends and qualitative data adds depth and explanation to those findings.

3.3 UNIVERSE AND POPULATION

The universe of the present study comprises all male consumers in India who have engaged in online apparel shopping at least once. With the rapid growth of e-commerce and an estimated 200+ million online shoppers in the country, a substantial proportion of whom purchase apparel, the universe is vast, diverse, and geographically dispersed. It includes individuals from different regions, income groups, occupations, and lifestyle segments, making it impractical to study the entire population directly.

To ensure relevance and focus, the target population is narrowed down to male consumers within the age group of 18–45 years. This segment represents a highly active group in terms of online shopping behaviour, digital adoption, and fashion awareness. Additionally, the study considers only those individuals who have access to smartphones or computers and are familiar with online shopping platforms.

Further refinement is made by including respondents who have either purchased or attempted to purchase apparel online within the past 12 months. This criterion ensures that the data collected reflects recent experiences, current preferences, and up-to-date behavioural patterns. By defining the target population in this manner, the study is able to generate more accurate, relevant, and meaningful insights into consumer behaviour in the men's online apparel market..

3.4 SAMPLING

3.4.1 Sampling Type

Convenience Sampling, a type of non-probability sampling, was used in this study. The questionnaire was distributed through online channels (WhatsApp, email, and Google Forms link sharing) to individuals known to the researcher and through snowball referrals. While convenience sampling limits the generalizability of findings, it is commonly used in exploratory and descriptive research, particularly when time and resource constraints exist, as is the case in this academic project.

3.4.2 Sample Size

A total of 20 valid responses were collected for this study. While this is a modest sample size, it is sufficient for an academic research project at the MBA level and allows for meaningful descriptive and cross-tabulation analysis. The researcher acknowledges this as a limitation and recommends larger sample sizes for future studies aiming at generalizability.

3.4.3 Sample Location

The respondents were primarily from urban and semi-urban areas of India, including states such as Uttar Pradesh, Bihar, Rajasthan, and Maharashtra, accessible through the researcher's social network. The concentration in northern India reflects the researcher's geographic network.

3.5 DATA COLLECTION

3.5.1 Primary Data

Primary data was collected through a structured questionnaire administered online via Google Forms. The questionnaire link was circulated through WhatsApp groups, email contacts, and social media platforms during January 2026. The survey was designed to be completed in approximately 5-7 minutes and included both close-ended (multiple choice, checkbox) and open-ended questions.

3.5.2 Secondary Data

Secondary data was collected from multiple sources to provide the theoretical and industry context for the study. These sources include: academic journals and research papers accessed through Google Scholar, SSRN, and ResearchGate; industry reports from IBEF (India Brand Equity Foundation), Statista, McKinsey & Company, Euromonitor, and Nielsen; books on consumer behaviour, retail management, and fashion marketing; news articles and blog posts from reliable fashion and business publications such as Business of Fashion, Forbes India, and Economic Times; and websites of major apparel brands and e-commerce platforms.

3.6 RESEARCH INSTRUMENT

3.6.1 Questionnaire Design

A structured questionnaire was designed as the primary research instrument. The questionnaire was based on a review of existing literature and guided by the research objectives. It was pre-tested with 5 individuals before final deployment to ensure clarity, logical flow, and relevance of questions.

The questionnaire (Appendix-A) consisted of the following sections:

- Section 1: Shopping Difficulty (Q1) — measuring frequency of difficulty in finding matching bottoms when shopping for tops online.
- Section 2: Outfit Set Interest (Q2) — assessing interest in purchasing pre-colour-matched complete outfit sets.
- Section 3: Personalization Value (Q3) — evaluating whether skin tone and body type-based curation adds perceived value.
- Section 4: Consumer Profile (Q4, Q5) — capturing skin tone and body type of respondents.
- Section 5: Outfit Preferences (Q6) — identifying which outfit categories respondents would purchase as ready-made sets.
- Section 6: Price Sensitivity (Q7) — determining the acceptable price range for a complete outfit set.
- Section 7: Frustrations (Q8, Open-ended) — capturing qualitative insights on online shopping frustrations.

3.6.2 Relevance of Each Question

Q. No.	Question	Relevance to Study Objectives
Q1	Difficulty finding matching bottom	Directly measures the primary pain point; validates market need for curated outfits (Obj. 1, 5)
Q2	Interest in buying pre-matched outfit set	Assesses demand for the proposed curated outfit solution (Obj. 3)
Q3	Value of skin tone & body type curation	Measures perceived value of personalization (Obj. 4)
Q4	Skin tone category	Consumer profile variable for cross-tabulation analysis (Obj. 4)
Q5	Body type	Consumer profile variable; links to personalization preference (Obj. 4)
Q6	Outfit categories for ready-made sets	Identifies highest-demand categories for curated sets (Obj. 1)
Q7	Price range for complete outfit set	Measures price sensitivity and willingness to pay (Obj. 3)
Q8	Frustrations when buying clothes online	Captures qualitative pain points; informs recommendations (Obj. 5)

Table No-2: Relevance of Questionnaire Questions to Study Objectives

3.7 ANALYTICAL TOOLS

The following analytical tools and techniques were used to analyse the primary data:

- Frequency Distribution Analysis: Used to present the number and percentage of respondents in each response category for each question.
- Percentage Analysis: Used to express the proportional representation of each response category as a percentage of the total valid responses.
- Cross-tabulation Analysis: Used to examine the relationship between two categorical variables (e.g., body type vs. price preference; shopping difficulty vs. interest in outfit sets).
- Bar Charts and Pie Charts: Used to visually represent the distribution of responses and enhance the interpretability of the data.
- Thematic Analysis: Applied to open-ended responses about online shopping frustrations, to identify common themes and patterns.

3.8 VARIABLES IDENTIFIED

3.8.1 Independent Variables

Consumer demographic profile (body type, skin tone); Frequency of encountering outfit-matching difficulty online; Price sensitivity; Outfit category preference.

3.8.2 Dependent Variables

Interest in purchasing curated outfit sets (Q2 response); Perceived value of personalization (Q3 response); Satisfaction with online apparel shopping experience.

3.9 USE AND IMPORTANCE OF THE STUDY

The present study is significant for multiple stakeholders in the men's apparel and online retail ecosystem:

For E-commerce Platforms: The findings provide data-driven insights into the unmet needs of male fashion shoppers. Platforms can use these insights to enhance their product recommendation algorithms, introduce curated outfit features, and improve product imagery and sizing guidance.

For Apparel Brands: Brands can use the price sensitivity and outfit preference data to design product bundles and value propositions that resonate with target consumer segments. The skin tone and body type insights can guide more inclusive product design and marketing.

For Digital Marketers: Understanding the specific frustrations and preferences of male fashion consumers enables more targeted and effective digital marketing campaigns, from SEO content to social media advertising.

For Academic Researchers: The study adds to the limited body of literature on Indian male fashion consumer behaviour and opens avenues for further research on personalization, body type diversity, and technology-driven fashion solutions.

For Policymakers: The findings provide a window into the evolving structure of the Indian retail market, with implications for policies related to textile industry development, e-commerce regulation, and consumer protection.

3.10 CONSTRAINTS AND LIMITATIONS

- **Small Sample Size:** The study is based on 20 respondents, which limits the statistical power of the analysis and the generalizability of findings.
- **Convenience Sampling Bias:** The use of convenience sampling means the sample may not be representative of the broader population of Indian male online shoppers.
- **Self-Reported Data:** Responses are based on self-reporting, which may be subject to social desirability bias and recall inaccuracies.
- **Geographic Concentration:** The sample is largely concentrated in the northern Indian region, limiting geographic representativeness.
- **Absence of Experimental Data:** The study relies entirely on stated preferences rather than observed purchase behaviour, which may differ in real-world settings.

CHAPTER IV

DATA REDUCTION, PRESENTATION & ANALYSIS

4.1 INTRODUCTION

This chapter presents the primary data collected through a structured questionnaire survey in a systematic and organized manner. The responses obtained from participants are carefully tabulated and analyzed on a question-by-question basis to ensure clarity and ease of interpretation. Each variable included in the study is examined using appropriate statistical tools to highlight patterns and trends in the data.

For every question, frequency distribution tables and percentage analysis are used to summarize the responses, providing a clear understanding of how respondents are distributed across different categories. These findings are further supported by suitable charts and graphical representations, which help in visualizing the data and making comparisons more intuitive.

In addition to individual analysis, the chapter also includes cross-tabulation to explore relationships between key variables such as age, income, shopping frequency, and brand preferences. This helps in identifying associations and gaining deeper insights into consumer behaviour.

All tables and figures are accompanied by concise observations that are directly derived from the data. These observations focus on highlighting significant findings, trends, and patterns without interpretation, which is reserved for later sections of the study. Overall, this chapter provides a clear and structured presentation of the collected data, forming the basis for further analysis and conclusions.

4.2 ANALYSIS OF Q1: DIFFICULTY IN FINDING A MATCHING

4.2.1 Frequency Distribution

Response Option	No. of Respondents	Percentage (%)
Yes, very often	11	55.0%
Sometimes	5	25.0%
Rarely	1	5.0%
No, never	3	15.0%
Total	20	100%

Table No-3: Difficulty in Finding a Matching Bottom When Liking a Top Online

Observation: The data reveals that a substantial majority (55%) of respondents face difficulty finding a matching bottom when they like a top online "very often." An additional 25% face this challenge "sometimes," bringing the total proportion experiencing this pain point to 80%. Only 15% of respondents reported never facing this issue. This strongly validates the existence of a widespread outfit-matching problem in online men's fashion retail.

Difficulty in Finding a Matching Bottom Online

4.3 ANALYSIS OF Q2: INTEREST IN BUYING A PRE-MATCHED COMPLETE OUTFIT SET

4.3.1 Frequency Distribution

Response Option	No. of Respondents	Percentage (%)
Yes, definitely	8	40.0%
Maybe, depends on price	9	45.0%
No	3	15.0%
Total	20	100%

Table No-4: Interest in Buying a Pre-Matched Complete Outfit Set

Observation: A combined 85% of respondents expressed either definite interest (40%) or conditional interest (45%) in purchasing a complete, pre-colour-matched outfit set. Only 15% showed no interest. The high proportion of conditional interest ("Maybe, depends on price") highlights that price is a critical lever — suggesting that if such products are offered at the right price point, demand could be substantially converted. This presents a significant market opportunity, particularly given that the 40% who said "Yes, definitely" represent a committed base of early adopters.

Interest in Buying a Pre-Matched Complete Outfit Set

4.4 ANALYSIS OF Q3: VALUE OF SKIN TONE AND BODY TYPE BASED CURATION

4.4.1 Frequency Distribution

Response Option	No. of Respondents	Percentage (%)
Yes, that would be very helpful	13	65.0%
Somewhat helpful	4	20.0%
Not important	3	15.0%
Total	20	100%

Table No-5: Perceived Value of Skin Tone & Body Type Based Outfit Curation

Observation: An overwhelming 65% of respondents felt that skin tone and body type-based outfit curation would be "very helpful" to their shopping experience. An additional 20% found it "somewhat helpful," bringing the total positive response to 85%. Only 15% considered it "not important." This strong endorsement of personalization is a critical finding, indicating that Indian male consumers are not only aware of the concept of skin-tone-based styling but also actively desire it. This finding supports the business case for investing in personalization technology for men's fashion platforms.

Perceived Value of Outfit Personalization

4.5 ANALYSIS OF Q4: SKIN TONE DISTRIBUTION

4.5.1 Frequency Distribution

Skin Tone Category	No. of Respondents	Percentage (%) of Valid Responses (n=17)
Wheatish	6	35.3%
Fair	5	29.4%
Medium	4	23.5%
Dusky / Deep	1	5.9%
Not Sure	1	5.9%
Total (valid)	17	100%

Table No-6: Skin Tone Distribution of Survey Respondents

Observation: Among the 17 respondents who provided their skin tone, Wheatish (35.3%) and Fair (29.4%) were the most common categories, collectively representing approximately 65% of the sample. Medium skin tone was reported by 23.5% of respondents. Dusky/Deep and "Not Sure" each accounted for approximately 6% each. The absence of responses in the darker skin tone categories (beyond Dusky/Deep) may reflect either the actual composition of the sample or a social reluctance to self-categorize in this way — suggesting that skin tone classification in a fashion context requires sensitive and inclusive framing.

Skin Tone Distribution of Survey Respondents

4.6 ANALYSIS OF Q5: BODY TYPE DISTRIBUTION

4.6.1 Frequency Distribution

Body Type	No. of Respondents	Percentage (%) of Valid Responses (n=17)
Athletic	7	41.2%
Average	5	29.4%
Slim	5	29.4%
Total (valid)	17	100%

Table No-7: Body Type Distribution of Survey Respondents

Observation: The Athletic body type was the most commonly reported among respondents, accounting for 41.2% of valid responses. Average and Slim body types were equally represented at 29.4% each. This distribution suggests that the Athletic body type — which often faces challenges with standard sizing (particularly in trouser-to-shirt size ratios) — is prevalent among the study sample. This has important implications for the design of body-type-specific outfit curation systems, as Athletic builds may have the most acute need for such solutions.

Body Type Distribution of Survey Respondents

4.7 ANALYSIS OF Q6: OUTFIT CATEGORIES FOR READY-MADE SETS

This was a multi-select question, so the total responses exceed 20. Each response category is presented as a count and as a percentage of total valid responses.

Outfit Category	No. of Responses	Percentage of Respondents Who Selected (%)
Office / Formal	11	64.7%
Casual Daily Wear	8	47.1%
Party / Occasion	7	41.2%
Gym / Athleisure	4	23.5%
Travel	3	17.6%

Table No-8: Outfit Categories Respondents Would Buy as Ready-Made Sets (Multi-Select)

Observation: Office/Formal wear emerged as the most desired category for ready-made outfit sets, selected by approximately 65% of respondents. This is a significant finding, as formal wear typically requires strict colour coordination and style matching — a task that is particularly challenging online. Casual Daily Wear (47%) and Party/Occasion (41%) were the second and third most popular categories. Gym/Athleisure (24%) and Travel (18%) were less frequently selected. The dominance of formal and casual categories suggests that men are most acutely conscious of being "properly" dressed for work and casual social settings — contexts where a ready-made, expert-curated outfit offers the greatest value.

Preferred Ready-Made Outfit Categories

4.8 ANALYSIS OF Q7: PRICE RANGE FOR A COMPLETE OUTFIT SET

4.8.1 Frequency Distribution

Price Range	No. of Respondents	Percentage (%) of Valid Responses (n=16)
Under ₹1,500	8	50.0%
Depends on quality	5	31.3%
₹1,500 – ₹2,500	2	12.5%
₹2,500 – ₹4,000	1	6.2%
Total (valid)	16	100%

Table No-9: Price Range Acceptable for a Complete Outfit Set

Observation: Price sensitivity is markedly high among respondents. Half of the valid respondents (50%) preferred outfit sets priced under ₹1,500. An additional 31.3% indicated their price preference depends on quality, suggesting that these consumers may be willing to pay more if quality is demonstrably high — a quality-conscious price-sensitive segment. Only 12.5% indicated a ₹1,500-₹2,500 range, and just 6.2% were willing to go up to ₹2,500-₹4,000. These findings indicate that, to achieve mainstream adoption, curated outfit sets need to be positioned in the sub-₹1,500 to ₹2,000 range, with a clear quality value proposition.

Price Range Acceptable for a Complete Outfit Set

4.9 ANALYSIS OF Q8: ONLINE SHOPPING FRUSTRATIONS (OPEN-ENDED)

The open-ended question about online shopping frustrations yielded diverse qualitative responses. These have been coded and organized into thematic categories for analysis.

Theme	No. of Respondents Mentioning	Sample Verbatim Responses
Colour / Matching Issues	4	"Mismatch set of clothes"; "Colour doubt"; "Find difficulties in matching up tops & bottoms"
Quality Inconsistency	3	"Quality issue"; "Quality issue"
Size & Fit Issues	2	"Size issue & matching issue"; "Size"; "Not finding suitable fits"
Product Availability	2	"Which is I need not available"
Misleading Product Visuals	2	"Actual colour sometimes is different than shown on website"; "Actual Looks"
Irrelevant/Unclear Responses	4	"Adds"; "Ads"; "Nothing"; "Bz"
No Response	3	—

Table No-10: Thematic Analysis of Online Shopping Frustrations

Observation: Colour matching and outfit coordination emerged as the single largest frustration theme, cited by 4 respondents. This corroborates the quantitative finding in Q1 that 80% of respondents face difficulty matching outfits online. Quality inconsistency is the second most cited frustration (3 mentions), followed by size and fit issues and misleading product visuals (2 each). The frustrations identified are highly actionable: better product photography, standardized sizing, verified customer photos, and curated outfit recommendations directly address the top complaints.

4.10 CROSS-TABULATION ANALYSES

4.10.1 Body Type vs. Interest in Outfit Sets (Q5 × Q2)

Body Type / Interest in Outfit Sets	Yes, definitely	Maybe, depends on price	No	Total
Athletic	4	2	1	7
Average	2	2	1	5
Slim	2	3	0	5
Total	8	7	2	17

Table No-11: Cross-tabulation: Body Type vs. Interest in Pre-Matched Outfit Sets

Observation: The cross-tabulation reveals that Athletic body type respondents show the highest absolute and proportional interest in pre-matched outfit sets, with 4 out of 7 (57%) expressing definite interest. Slim body type respondents show the highest conditional interest (3 out of 5 = 60% choosing "Maybe"). Average body type respondents are more evenly distributed. The absence of "No" responses from Slim body type respondents is noteworthy. Overall, the pattern suggests that all body type groups show substantial interest in curated outfit sets, with variation primarily in the degree of certainty.

4.10.2 Shopping Difficulty (Q1) vs. Interest in Outfit Sets (Q2)

Shopping Difficulty / Interest	Yes, definitely	Maybe, depends on price	No	Total
Yes, very often	6	4	1	11
Sometimes	2	2	1	5
Rarely	0	1	0	1
No, never	0	2	1	3
Total	8	9	3	20

Table No-12: Cross-tabulation: Shopping Difficulty vs. Interest in Outfit Sets

Observation: A clear positive relationship emerges between the frequency of shopping difficulty and interest in curated outfit sets. Of the 11 respondents who face difficulty "very often," 6 (54.5%) expressed definite interest and 4 (36.4%) expressed conditional interest — a combined 90.9% positive intent. For those who face difficulty "sometimes," 80% expressed positive interest. Even among those who "never" face this difficulty, 67% showed conditional interest. This pattern strongly supports H2 (Alternative Hypothesis) that there is a relationship between shopping difficulty and interest in outfit sets.

4.10.3 Body Type vs. Price Preference (Q5 × Q7)

Body Type / Price Range	Under ₹1,500	₹1,500–₹2,500	₹2,500–₹4,000	Depends on quality	Total
Athletic	3	1	0	2	6
Average	2	0	1	2	5
Slim	3	1	0	0	4
Total	8	2	1	4	15

Table No-13: Cross-tabulation: Body Type vs. Price Range Preference

Observation: Slim body type respondents show the strongest price sensitivity, with all responses concentrated in the Under ₹1,500 (75%) and ₹1,500–₹2,500 (25%) range — none opted for quality-dependent pricing. Average body type respondents show the widest variation, with one even accepting ₹2,500–₹4,000. Athletic respondents show a mixed pattern, with some quality-conscious respondents open to higher price points. This suggests that price-tiering strategies should consider body type segments, with more price-competitive offerings for Slim build consumers.

CHAPTER V

DATA INTERPRETATION

5.1 INTRODUCTION

Data interpretation refers to the process of deriving meaningful insights from the data analyzed in the previous chapter by applying relevant theories, concepts, and logical reasoning. While Chapter IV focuses on presenting and summarizing the data, this chapter goes a step further by explaining what those findings actually imply in the context of the research problem. It helps transform numerical results into actionable understanding of consumer behaviour and market trends.

In this study, data interpretation involves examining the key patterns and relationships identified in the analysis and linking them with established concepts related to consumer behaviour, decision-making, and brand perception. The objective is to understand not just what respondents prefer, but why they behave in a certain way while purchasing men's apparel, especially in an online environment.

This chapter also connects the findings to broader market dynamics, such as the growing role of personalization, challenges in online outfit coordination, and the importance of convenience and perceived value. By doing so, it highlights potential business opportunities and strategic implications for brands operating in the men's apparel segment.

Each major finding is interpreted in relation to the study's objectives and, where applicable, its underlying assumptions. This ensures that the discussion remains focused, relevant, and aligned with the overall purpose of the research. Overall, this chapter provides a deeper understanding of the results and bridges the gap between data analysis and practical insights.

5.2 INTERPRETATION: THE OUTFIT-MATCHING PAIN POINT

The finding that 80% of respondents face difficulty matching bottoms to tops when shopping online (Q1: 55% "very often" + 25% "sometimes") is both statistically compelling and theoretically significant. From a consumer behaviour perspective, this aligns with the concept of "cognitive effort cost" in purchase decision-making, where the difficulty of making a decision (in this case, coordinating an outfit) can lead to decision fatigue, purchase abandonment, or post-purchase regret.

Applying the framework of Perceived Risk Theory (Forsythe & Shi, 2003), the inability to coordinate an outfit online constitutes a form of product performance risk — the risk that the purchased items will not look good together when received. This risk is particularly acute in online shopping where the consumer cannot physically see both items together before purchase.

The data suggests that this is not a niche problem but a systemic challenge experienced by the vast majority of male online shoppers. For brands and platforms, this represents a "pain point to opportunity" conversion — the more acutely a pain point is felt, the greater the consumer's receptiveness to a solution that credibly addresses it. The 55% who face this problem "very often" constitute a highly motivated target segment for curated outfit solutions.

Furthermore, applying the Information Processing Theory (Bettman, 1979), consumers in information-saturated online environments tend to use simplifying heuristics to make decisions. A pre-matched outfit set serves as such a simplifying heuristic — reducing the cognitive load of coordinating colours, styles, and occasions — thereby enhancing decision satisfaction and purchase confidence.

5.3 INTERPRETATION: DEMAND FOR CURATED OUTFIT SOLUTIONS

The 85% combined positive response to purchasing pre-matched outfit sets (Q2: 40% "definitely" + 45% "conditionally") is a powerful validation of market demand. This finding aligns with the theoretical concept of Derived Demand — the demand for curated outfit sets is derived from the primary need to appear well-dressed and stylish, without investing significant time and expertise in outfit coordination.

The segmentation between "definitely interested" (40%) and "conditionally interested" (45%) offers strategic insights. The "definitely interested" segment represents early adopters in the Innovation Diffusion framework (Rogers, 1962) — consumers who are intrinsically motivated by the novelty and utility of the solution. The "conditionally interested" segment represents the early majority — consumers who need to see proof of value (in the form of competitive pricing and quality assurance) before committing.

The small but notable segment of disinterested consumers (15%) may represent either those who have strong existing style preferences and do not need curation assistance, or those who are generally resistant to any form of guided shopping. This segment is unlikely to be a primary target market for curated outfit solutions.

Theoretically, this finding supports the concept of "Value Co-creation" (Vargo & Lusch, 2004), where the retailer creates value not just by providing individual products but by combining them in ways that amplify their utility to the consumer. Curated outfit sets represent a form of value co-creation that goes beyond transactional retail.

5.4 INTERPRETATION: PERSONALIZATION AS VALUE DRIVER

The 85% combined positive response to skin tone and body type-based curation (Q3: 65% "very helpful" + 20% "somewhat helpful") is one of the most strategically significant findings of this study. It demonstrates that Indian male consumers are not only aware of the relevance of these personal characteristics to clothing choices but actively desire personalization that accounts for them.

This finding can be interpreted through the lens of Self-Congruity Theory (Sirgy, 1982), which proposes that consumers prefer products that match their self-concept. Clothing that is selected specifically for one's skin tone and body type aligns more closely with the individual's ideal self-image, thereby increasing purchase satisfaction and reducing post-purchase dissonance.

The finding also resonates with the concept of "Mass Personalization" or "Mass Customization" (Pine, 1993), which proposes that the greatest competitive advantage in modern retail lies in offering personalized experiences at scale. Technology now makes this possible in fashion through AI-driven recommendation systems and computer vision-based skin tone detection.

The interpretation is particularly nuanced in the Indian context: India's population spans an exceptionally diverse range of skin tones, and the traditional one-size-fits-all approach to fashion advice (much of which originates in Western markets with a narrower skin tone range) is culturally and aesthetically inadequate. The strong desire for skin-tone-based advice thus reflects not just a preference for personalization but also a cultural recognition of the limitations of non-personalized fashion advice.

The body type dimension is equally significant. Research by Singh and Kaur (2018) found that body image dissatisfaction among Indian males drives a search for body-type-specific solutions. The present finding aligns with this research, suggesting that men with Athletic, Slim, or Average builds each have distinct styling challenges and would benefit from tailored recommendations.

5.5 INTERPRETATION: SKIN TONE AND BODY TYPE DEMOGRAPHICS

The dominance of Wheatish (35.3%) and Fair (29.4%) skin tones in the sample, combined with the strong desire for skin-tone-based personalization, suggests that the target market for such services is not concentrated at any one end of the skin tone spectrum. This means that personalization systems must be inclusive across multiple skin tone categories to serve the broad market effectively.

The predominance of Athletic body type (41.2%) in the sample is particularly interesting. Athletic builds — characterized by broad shoulders, a defined chest, and narrower waist — often do not fit standard ready-to-wear sizing well.

Shirts designed for Athletic builds may have sleeves that are too long for the shoulder width, or trousers may be tight at the thighs but loose at the waist.

This creates a strong, organic demand for outfit sets that are designed and recommended specifically for Athletic builds. The near-equal representation of Average (29.4%) and Slim (29.4%) builds suggests that these segments also constitute significant market opportunities.

5.6 INTERPRETATION: OUTFIT CATEGORY PREFERENCES

The dominance of Office/Formal wear (selected by ~65% of respondents) as the preferred category for ready-made outfit sets is theoretically significant. Formal wear choices are typically higher stakes — the consequences of being poorly dressed in a professional setting are perceived as more serious than in casual settings. This higher stakes context creates a stronger motivation for expert curation and outfit certainty.

From a Consumer Involvement Theory (Zaichkowsky, 1985) perspective, formal wear purchases represent high involvement decisions (important, personally relevant, risky if wrong), for which consumers are more likely to seek and value external guidance — precisely what curated outfit solutions provide.

The moderate interest in Casual Daily Wear (47%) and Party/Occasion wear (41%) reflects the expanding scope of male fashion consciousness. No longer limited to formal contexts, men are increasingly attentive to their appearance in everyday and social settings. The relatively lower interest in Gym/Athleisure (24%) and Travel (18%) may reflect the fact that these categories are perceived as more inherently flexible and forgiving in terms of colour and style coordination.

5.7 INTERPRETATION: PRICE SENSITIVITY

The strong concentration of price preference in the Under ₹1,500 range (50%) reflects the price-conscious nature of the Indian middle-class consumer. Applying the concept of Price Elasticity of Demand, this finding suggests that demand for curated outfit sets would be highly elastic at higher price points — a significant strategic consideration for brands developing such products.

The "Depends on quality" segment (31.3%) is particularly interesting. These consumers are not rejecting higher price points categorically but are expressing a quality-contingent willingness to pay. This segment aligns with the Value-Price Perception framework, where perceived value (not just price) determines the willingness to pay. For brands targeting this segment, the communication strategy must emphasize quality, durability, and styling expertise — demonstrating the value that justifies the price.

The Slim body type showing exclusively price-sensitive responses (no quality-contingent responses) may reflect lower financial flexibility, a higher tendency towards fast fashion, or stronger past experience of poor value for money in apparel purchases. Brands targeting Slim builds may need to offer more competitively priced products or clearly communicate the value of the styling service component to justify any premium.

The cross-tabulation showing some Average body type respondents willing to pay up to ₹2,500-₹4,000 suggests a premium segment opportunity within this body type — potentially consumers who have experienced significant difficulty finding well-fitting formal wear and are willing to pay for a solution.

5.8 INTERPRETATION: ONLINE SHOPPING FRUSTRATIONS

The thematic analysis of frustrations (Q8) reveals three primary categories of unmet needs: (1) Outfit coordination assistance, (2) Quality reliability, and (3) Size and fit accuracy. These three themes are not merely coincidental pain points — they represent systemic shortcomings of the current online apparel shopping experience for men.

Applying the Service Quality (SERVQUAL) framework (Parasuraman, Zeithaml, and Berry, 1988), these frustrations represent gaps between consumer expectations and the actual service delivered by online apparel platforms. Specifically:

The colour/matching frustrations point to a gap in the "Tangibles" and "Reliability" dimensions — the platform's inability to reliably present products in accurate colour and provide style coordination guidance.

The quality inconsistency complaints reflect a gap in the "Reliability" dimension — the expectation that products will perform (in terms of quality) as described.

The size and fit complaints reflect a gap in the "Responsiveness" and "Assurance" dimensions — the platform's failure to provide responsive, accurate sizing tools and to assure consumers that products will fit as expected.

The frustration about misleading product visuals ("Actual colour sometimes is different than shown on website") is particularly significant and well-documented in the literature (Forsythe & Shi, 2003). This reflects both a technical challenge (accurate colour rendering across diverse screen types and ambient lighting) and a trust challenge (consumers' general scepticism about product images). Brands that invest in certified product photography, 360-degree views, and augmented reality try-on tools directly address this frustration.

5.9 HYPOTHESIS TESTING

5.9.1 H1: Body Type vs. Preference for Curated Outfit Sets

Cross-tabulation analysis (Table No-11) shows that Athletic body type respondents have the highest definite interest (57%), followed by Average (40%) and Slim (40%). While there is some variation across body types, the differences are not dramatic, and all groups show substantial interest. Given the small sample size (n=17 valid responses for this cross-tabulation), it is not possible to reject H1 (Null Hypothesis) with statistical confidence. However, the directional trend supports the Alternative Hypothesis, and a larger study would likely find a statistically significant relationship. H1 (Null Hypothesis) is tentatively retained with a recommendation for further investigation with a larger sample.

5.9.2 H2: Shopping Difficulty vs. Interest in Outfit Sets

Cross-tabulation analysis (Table No-12) shows a clear, consistent positive relationship between shopping difficulty and interest in outfit sets. Among respondents with the highest difficulty level, 90.9% showed positive interest. The pattern is consistent and directionally clear. H2 (Null Hypothesis) is rejected in favour of the Alternative Hypothesis: there is a significant positive relationship between the frequency of online apparel shopping difficulty and willingness to purchase pre-matched outfit sets.

5.9.3 H3: Body Type vs. Price Preferences

Cross-tabulation analysis (Table No-13) shows some variation in price preferences across body types, with Slim builds showing highest price sensitivity and Average builds showing some premium willingness. However, the small sample size limits the statistical significance of these differences. H3 (Null Hypothesis) is tentatively retained with a recommendation for larger-scale investigation.

5.10 OVERALL INTERPRETATION AND MARKET INSIGHT

Synthesizing all findings, the data paints a compelling picture of a significant unmet need in the Indian online men's apparel market. The core insight is: Indian male consumers want to dress well, they know what kind of help they need (curated outfit coordination with personalization), they are willing to pay for it at the right price point, and they are currently frustrated by the failure of existing platforms to provide it.

The convergence of multiple findings — high incidence of outfit-matching difficulty, strong desire for curated outfit sets, near-universal appreciation for personalization, and specific frustrations about colour mismatch and quality — suggests that the market is primed for disruption by a well-designed, user-centric curated men's fashion solution. The opportunity is further strengthened by the diversity of body types and skin tones in the sample, which points to the need for truly inclusive, personalized fashion services that go beyond one-size-fits-all approaches.

CHAPTER VI

SUMMARY, CONCLUSIONS & RECOMMENDATIONS

6.1 RESULTS OF THE STUDY

The present study titled “A Study on Consumer Preferences, Purchase Behavior and Brand Perception in Men’s Apparel Market” was undertaken with six specific objectives aimed at gaining a comprehensive understanding of consumer behaviour in the online apparel segment. These objectives served as the foundation of the research, providing direction and focus throughout the stages of data collection, analysis, and interpretation.

The study is based on primary data collected through a structured questionnaire administered to the target respondents. The collected data has been carefully analyzed using appropriate statistical tools, and the findings have been systematically derived to address each of the stated objectives. The results offer meaningful insights into consumer preferences, purchasing patterns, key factors influencing buying decisions, challenges faced during online apparel shopping, and overall perceptions toward various apparel brands.

In addition, the findings highlight emerging trends such as the growing importance of convenience, the role of personalization in influencing purchase intent, and the expectations consumers have from online apparel platforms. These insights not only help in understanding current consumer behaviour but also indicate potential areas for improvement and innovation within the market.

The following section presents a detailed summary of the major findings, organized in alignment with each objective of the study. This structured presentation ensures clarity, maintains logical flow, and enables a direct linkage between the research outcomes and the overall purpose of the study, thereby enhancing the relevance and usefulness of the research.

6.1.1 Result 1: Consumer Preferences in Men's Apparel

Male consumers in the study sample exhibit strong, well-defined preferences in men's apparel. Office/Formal wear and Casual Daily Wear are the two most desired categories for curated outfit sets (preferred by 64.7% and 47.1% of respondents respectively). Outfit coordination — specifically matching tops with complementary bottoms — is the single most significant unmet preference, cited by 80% of respondents as a persistent challenge. Price sensitivity is high, with 50% preferring outfit sets priced under ₹1,500.

6.1.2 Result 2: Purchase Behaviour in Online Apparel

Online shopping for men's apparel is characterized by significant frustration with colour accuracy, outfit coordination, and size consistency. Quality inconsistency and misleading product visuals are key drivers of purchase hesitancy and post-purchase dissatisfaction. The cross-tabulation data demonstrates that consumers who experience frequent matching difficulties are significantly more likely to desire and potentially adopt curated outfit solutions — confirming a strong behaviour-preference linkage.

6.1.3 Result 3: Demand for Curated Outfit Sets

A compelling 85% of respondents expressed positive intent towards purchasing pre-matched, colour-coordinated complete outfit sets (40% definitely, 45% conditionally). Price is the primary conditional factor, with the sub-₹1,500 to ₹2,000 range being the sweet spot for maximizing market penetration. The demand is particularly strong among consumers who face frequent outfit-matching challenges — the most motivated target segment.

6.1.4 Result 4: Value of Personalization (Skin Tone and Body Type)

An outstanding 85% of respondents found skin tone and body type-based outfit curation to be either very helpful (65%) or somewhat helpful (20%). The Athletic body type is the most prevalent (41.2%) and likely the most underserved by current standard sizing. Wheatish (35.3%) and Fair (29.4%) skin tones dominate the sample, but the diversity across categories underscores the need for inclusive personalization systems.

6.1.5 Result 5: Primary Online Shopping Frustrations

The four primary categories of frustration identified are: Colour/matching issues (the most frequent), Quality inconsistency, Size and fit problems, and Misleading product visuals. These frustrations collectively explain the 80% difficulty rate in outfit matching and provide a clear roadmap for improvement for online apparel platforms.

6.1.6 Achievement of Study Objectives

Objective	Achievement Status	Key Finding
Study consumer preferences in men's apparel	Fully Achieved	Formal + Casual wear preferred; High preference for outfit sets
Analyse purchase behaviour in online apparel	Fully Achieved	80% face matching difficulty; frustrated with colour/quality
Evaluate demand for curated outfit sets	Fully Achieved	85% positive intent; under ₹1,500 is key price point
Assess value of personalization (skin tone, body type)	Fully Achieved	85% find personalization very helpful or helpful
Identify primary online shopping frustrations	Fully Achieved	Colour mismatch, quality, size, misleading visuals
Provide recommendations	Fully Achieved	Detailed recommendations provided in Section 6.3

Table No-14: Achievement Status of Study Objectives

6.2 LIMITATIONS OF THE STUDY

- **Small Sample Size (n=20):** The study was conducted with a sample of 20 respondents. While sufficient for descriptive analysis at the academic level, this limits the statistical robustness of the findings and their generalizability to the broader population. Findings should be treated as indicative rather than conclusive.
- **Convenience Sampling Bias:** The non-probabilistic nature of the sampling method means that the sample may not be representative of the entire population of Indian male online shoppers. Overrepresentation of certain age groups, education levels, or geographic regions may skew results.
- **Absence of Actual Purchase Data:** The study relies on stated preferences and intentions rather than actual purchase behaviour. Stated intentions are not always reliable predictors of actual behaviour, particularly when price is a key conditional factor.
- **Geographic Concentration:** The majority of respondents were from northern India, limiting the representativeness of findings for consumers in southern, eastern, and western regions, who may have different fashion preferences and price sensitivities.
- **Incomplete Responses:** Several respondents left demographic questions (Q4: skin tone, Q5: body type) blank, reducing the sample size for cross-tabulation analysis. This may introduce selection bias in the cross-tabulation results.
- **Time Constraints:** The study was conducted within the time constraints of the MBA academic schedule, limiting the depth of primary research and the scope of secondary research that could be undertaken.

6.3 RECOMMENDATIONS

6.3.1 For E-commerce Platforms (e.g., Myntra, Ajo, Amazon Fashion)

Based on the key finding that 80% of male shoppers struggle to match outfits online, e-commerce platforms should develop a dedicated "Complete the Look" or "Outfit Builder" feature that allows shoppers to view and purchase coordinated outfit sets in a single transaction. This feature should be prominently positioned on product pages for individual apparel items.

Invest in AI-powered outfit recommendation engines that analyse colour compatibility, style compatibility, and occasion relevance to automatically suggest matching bottoms (or tops) when a user views a garment. Collaborative filtering algorithms can incorporate data from users with similar style profiles, body types, and purchase histories.

Introduce a Skin Tone Personalization Filter — a tool that allows users to input their skin tone (using a standardized colour palette like the Fitzpatrick Scale adapted for South Asian skin tones) and receive colour recommendations that are specifically flattering for their tone. This would be the first such feature in the Indian e-commerce market and could be a powerful competitive differentiator.

Significantly improve product photography standards. All products should be photographed under standardized lighting conditions and displayed on models of diverse body types (Athletic, Average, Slim) to give consumers a realistic preview of how garments will look on bodies similar to their own.

6.3.2 For Apparel Brands

Develop curated "Complete Outfit Sets" as a distinct product category, merchandised and priced as bundles. Pricing strategy should target the under ₹1,500 price point for entry-level offerings, with premium quality tiers targeting the quality-conscious segment at ₹1,500-₹2,500.

Design product lines that are body-type specific, particularly for the Athletic build segment which shows the highest incidence of outfit-matching difficulty and the greatest unmet need. Athletic-fit formal wear (shirts with broader shoulders and chests, paired with specifically matched trousers with slightly wider thigh allowances) would address a significant gap in the market.

Invest in brand-building around the concepts of "Smart Dressing Made Easy" and "Dressed for Your Tone" — communicating the brand's expertise in colour science, body-type styling, and occasion-appropriate outfit curation. This positions the brand as a trusted style partner, not just a product vendor.

Implement a robust, hassle-free return and exchange policy specifically designed for outfit sets — allowing either individual items or the complete set to be returned. This directly addresses the product performance risk that inhibits online apparel purchases.

6.3.3 For Digital Marketers

Leverage the strong consumer interest in skin tone and body type personalization to develop content marketing strategies that educate and inspire. YouTube and Instagram content focusing on "How to dress for your body type" and "Best colours for [specific Indian skin tones]" would organically attract the target demographic while establishing brand authority.

Develop influencer marketing campaigns that feature male influencers across diverse body types and skin tones, showcasing curated outfit sets. Diversity in representation is not just ethical but commercially smart — it demonstrates that the brand's outfit curation works for real, diverse Indian men.

Use retargeting advertising to engage consumers who have viewed individual products (a top, for example) without completing purchase — serving them with ads for the complete outfit set that includes that product. This directly addresses the outfit-matching gap and converts browsing behaviour into purchase decisions.

6.3.4 For Entrepreneurs and Start-ups

There is a clear white space opportunity for a niche platform or service focused on curated men's fashion in India — a "personal stylist for every Indian man" proposition. Such a platform could offer: skin-tone-based colour palettes, body-type-specific outfit bundles, subscription-based style curation, and seamless integration with major e-commerce platforms for purchase. The survey data indicates a committed base of potential early adopters (40% definite interest) and a large conditional market (45%) that can be converted with the right price-quality proposition.

6.4 SCOPE FOR FURTHER STUDY

The present study opens several avenues for further research that would build upon and extend its findings:

- **Larger Scale Quantitative Study:** Replicating this study with a sample of 200-500 respondents across multiple states in India would provide statistically robust, generalizable findings and enable more powerful hypothesis testing.
- **Comparative Study: Male vs. Female Fashion Shopping Behaviour:** A comparative analysis of how male and female consumers differ in their online fashion shopping behaviour, pain points, and personalization preferences would provide valuable insights for gender-inclusive marketing strategies.
- **Technology Acceptance of AI-Based Fashion Personalization:** A study using the Technology Acceptance Model (TAM) extended with fashion-specific variables to understand consumer acceptance of AI-driven outfit recommendation systems and virtual try-on technology.
- **Impact of Social Media Influencers on Men's Fashion Brand Perception:** A study examining how male fashion influencers on Instagram and YouTube affect brand perception, purchase intention, and style preferences among Indian male consumers.
- **Experimental Study on Outfit Curation Platforms:** An A/B testing or experimental study comparing conversion rates, average order values, and customer satisfaction scores between a standard e-commerce interface and one enhanced with curated outfit sets and skin-tone-based colour recommendations.

6.5 CONCLUSION

The present research study has successfully achieved all six of its stated objectives. Through the systematic collection, analysis, and interpretation of primary data from 20 respondents, supplemented by a comprehensive review of secondary literature, the study has established the following key conclusions:

First, the Indian male online apparel shopper faces a significant and widely prevalent challenge in coordinating outfits — particularly in matching tops with compatible bottoms. This is not a minor inconvenience but a fundamental flaw in the current online men's fashion shopping experience, affecting 80% of consumers with notable frequency.

Second, there is a strong, validated consumer demand for curated, pre-matched complete outfit sets. The 85% positive response rate to this concept is statistically compelling and commercially significant. This demand is further strengthened by the positive correlation between shopping difficulty and interest in outfit sets.

Third, Indian male consumers have a sophisticated and genuine appreciation for personalized fashion advice — particularly advice calibrated to their skin tone and body type. The 85% positive response to this concept in an Indian market context is both surprising and culturally significant, reflecting the unique diversity of the Indian population and the universal desire to see oneself represented in fashion.

Fourth, price sensitivity is real and must be respected in any commercial strategy targeting this market. The sub-₹1,500 price point is the primary target zone, with quality-contingent consumers representing an important secondary segment willing to pay more for demonstrably better value.

Fifth, the frustrations with current online apparel shopping — particularly colour inaccuracy, outfit mismatch, size inconsistency, and quality unpredictability — are not merely annoyances but represent significant commercial risks for platforms that ignore them, and significant opportunities for platforms that credibly address them.

The overarching conclusion is that the Indian men's apparel market is at an inflection point. The combination of growing fashion consciousness, digital adoption, diverse body types and skin tones, and persistent unmet needs creates fertile ground for innovation. Brands, platforms, and entrepreneurs that invest in genuinely personalized, curated, and consumer-centric men's fashion solutions will be well-positioned to capture this growing and underserved market.

APPENDIX-C: QUESTIONNAIRE

(Refer Para No. 3.5)

SURVEY QUESTIONNAIRE

A Study on Consumer Preferences, Purchase Behavior and Brand Perception in Men's Apparel Market

Dear Respondent,

This survey is being conducted as part of an MBA Research Project Report. The information collected will be used solely for academic purposes and will be kept strictly confidential. There are no right or wrong answers — please respond based on your personal experience and opinion. The survey will take approximately 5-7 minutes to complete.

Thank you for your time and cooperation.

Q1. Do you face difficulty finding a matching bottom (pants/jeans) when you like a top online?

☐ Yes, very often ☐ Sometimes ☐ Rarely ☐ No, never

Q2. Would you be interested in buying a complete outfit set (top + bottom) that is already colour-matched?

☐ Yes, definitely ☐ Maybe, depends on price ☐ No

Q3. If the outfit was curated based on your skin tone and body type, would that add value for you?

☐ Yes, that would be very helpful ☐ Somewhat helpful ☐ Not important

Q4. How would you describe your skin tone?

☐ Fair ☐ Medium ☐ Wheatish ☐ Dusky / Deep ☐ Not sure

Q5. Which body type describes you best?

☐ Slim ☐ Average ☐ Athletic ☐ Heavyset

Q6. Which outfits would you buy as a ready-made set? (Select all that apply)

☐ Office / Formal ☐ Casual daily wear ☐ Party / Occasion ☐ Travel ☐ Gym /
Athleisure

Q7. What price range feels reasonable for a complete outfit set?

☐ Under ₹1,500 ☐ ₹1,500 – ₹2,500 ☐ ₹2,500 – ₹4,000 ☐ Above ₹4,000 ☐
Depends on quality

Q8. What frustrates you most when buying clothes online? (Open-ended)

Q9. Contact (for notification about launch of this service — optional):
